

UPcycling

We focus on conservation of resources

Junkers & Müllers has taken another step toward sustainability.

More and more articles from our extensive JM house range are made of 100% recycled post-consumer polyester, or more precisely from recycled PET bottles.

One square meter of this UPcycling material contains about nine PET bottles. This helps to curb the worldwide pollution caused by plastic waste, while recycling extends the life cycle of raw materials. The eco-balance of such a processes is encouraging! Energy usage and more importantly water consumption is much lower than when conventional chemical fibers are used - and contribute to reducing our ecological footprint.

With GALLERY UPcycling FR and COVERTEX UPcycling FR, Junkers & Müllers presents its first two recycled qualities for the digital printing market.

With the growing awareness of global climate change, the demand for environmentally friendly, resourceful products will increase. We are well prepared for this with our wide range of UPcycling products - both for sun shading and Mediatex®.
